PROFESSIONAL SUMMARY

Cybersecurity student focused on **detection engineering** and **security tooling**, with hands-on offensive and defensive experience. Built and attacked a **4-machine enterprise Active Directory lab**, then engineered the detection content that catches those attacks; deployed **Wazuh SIEM** with custom **MITRE ATT&CK**-aligned detection rules; built **ThreatLens**, a full-stack threat-intelligence and IOC enrichment platform; and authored **ClassroomEnv**, a **1,400-line Python** automation framework with reproducible Docker images. One loop, end to end: attack the lab, write the detection, automate the build. Targeting **detection engineering** and **security tooling** roles; open to penetration testing and SOC analyst positions.

TECHNICAL SKILLS

Detection & Defense: Wazuh SIEM, MITRE ATT&CK, Detection Engineering, Threat Hunting, Log Analysis, Custom Alert Tuning, Incident Response, Network Traffic Analysis

Offensive Security: BloodHound, Impacket, NetExec (nxc) / CrackMapExec, Metasploit, Burp Suite, Nmap, Responder

Attack Techniques: Kerberoasting, AS-REP Roasting, SMB Relay, Privilege Escalation, Lateral Movement

Development: Python (automation & tooling), FastAPI, React, Bash, Git, REST APIs, async httpx, VirusTotal / AbuselPDB / Shodan APIs

Infrastructure: Active Directory, Windows Server, Linux (3+ yrs daily), Proxmox, VMware, Docker, Nginx

Networking: TCP/IP, VLANs, Subnetting, DNS, DHCP, Firewall Configuration, Wireshark

Cloud & Web: Cloud Security Fundamentals, OWASP Top 10, Vulnerability Assessment, OSINT

PROJECTS

ClassroomEnv — Kali Linux Deployment Automation Framework

May 2026 – Present

- **1,500-line Python framework** standardizing Kali training environments: a declarative registry of **60+ tools** across 8 profiles, with recursive dependency resolution and per-tool installer routing across apt, pipx, and Go to avoid fragile source builds.
- Ships **reproducible per-profile Docker images** (shared core layer, CLI-only) so every machine pulls a byte-for-byte identical environment; resolved real integration failures — PEP 668 isolation via pipx, setuputils/pkg_resources breakage, Kali package-name collisions, and apt-vs-pipx PATH shadowing.
- Implemented floor-based version verification, fcntl exclusive locking, a doctor preflight (disk, apt state, connectivity, Go), hypervisor auto-detection via dmidecode, and a root-only JSON install inventory.

ThreatLens — Threat Intelligence Aggregation Platform

Mar 2026 – Present

- **Full-stack IOC enrichment platform** (FastAPI + React/Vite) querying **VirusTotal**, **AbuselPDB**, and **Shodan** concurrently via async httpx, with server-side API-key isolation and SQLite-cached lookup history; Docker Compose deployment.
- **Weighted, time-decayed risk scoring** (exponential 30-day half-life) fusing VT detections, AbuselPDB confidence, and Shodan CVE/CVSS data into one signal; IOC clustering via Jaccard similarity (0.65 threshold) with JSON/CSV export.
- Cut the abuse.ch feed layer (ThreatFox, Feodo Tracker) after undocumented API-policy changes broke keyless access — chose three stable, authenticated sources over fragile coverage, and kept the scoring model source-agnostic so feeds can be swapped without touching the engine.

Enterprise Active Directory Attack Lab

Sep 2025 – Present

- Built a **4-machine virtualized Active Directory environment** (DC, 2 Windows clients, Kali attacker) with AD DS, DNS, DHCP, GPO, OUs, and user provisioning replicating enterprise conditions.
- Executed full attack chains — **SMB Relay**, **Kerberoasting**, **AS-REP Roasting**, lateral movement, and privilege escalation via BloodHound, Impacket, and NetExec — then used the resulting telemetry to drive detection content.

Wazuh SIEM Detection Lab

Oct 2025

- Deployed self-hosted **Wazuh SIEM** with endpoint agents across multiple VMs; authored custom **MITRE ATT&CK**-aligned detection rules and alert thresholds tuned against controlled offensive scenarios; correlated events across dashboards for threat hunting and incident-response validation.
- Drove rule coverage directly from the AD lab: mapped observed SMB Relay, Kerberoasting, and AS-REP Roasting activity to specific detections and validated each alert end to end against a live attack rather than sample logs.

Security Portfolio Website — Vanilla JS, zero frameworks

2026

- **Single-page application** built from scratch in hand-written HTML/CSS/JS — no framework, no build step — with hash routing, an interactive in-browser terminal, and embedded long-form attack writeups; deployed on GitHub Pages.
- Hardened by default: strict **Content-Security-Policy** (no external scripts or third-party connections) plus a real-time animated canvas dither shader with live user-tunable controls.

EXPERIENCE

Freelance Cybersecurity Consultant — Independent · Remote

2025

- **Vulnerability assessments for 3 clients** — mapped attack-surface exposure and produced structured remediation reports with prioritized findings for non-technical stakeholders.
- Conducted **OSINT investigations** profiling client exposure across public-facing infrastructure.

LEADERSHIP

Vice President of Education — Rungta Toastmasters Club

3 Consecutive Terms

- Led educational programming for **50+ members**; designed curricula and anchored hackathons, technical events, and annual college festivals.

EDUCATION

B.Tech Computer Science — Cybersecurity Specialization

Expected 2027

Chhattisgarh Swami Vivekananda Technical University | CPI: **7.32 / 10**

CERTIFICATIONS & ONGOING LEARNING

PNPT — TCM Security (In Progress) | **Hack The Box** — Active (AD exploitation, privilege escalation) | **TryHackMe** — Active (Red Team & SOC Analyst paths)

SOFT SKILLS

Leadership, Communication, Public Speaking, Problem Solving, Analytical Thinking, Research, Adaptability, Teaching and Mentoring, Self-Starting Ability
